

Elizabeth (Lil) Lloyd-Jones

Front End Developer

Lymm, Cheshire | eil-j@hotmail.co.uk | 07907 287275 | linkedin.com/in/lil-corris

PERSONAL PROFILE

Front End Developer with 3 years' commercial experience building responsive, production-grade web and mobile applications with React and React Native. Has contributed front-end work across 18 live or launching client projects — 4 apps and 14 websites — acting as sole front-end developer on 2 of these, building independently from component architecture through to screens before a wider team joined for later-stage API work, working within a small team of 2-3 on the majority of the rest, and picking up legacy codebase and CMS ticket work on 5. Applies clean code standards and considered state management as standard practice, with growing exposure to TypeScript. Uses AI-augmented development tools, including Claude Code, to speed up delivery — recently cutting a component-architecture planning phase from 2-3 days down to under a day. Comfortable working across a range of codebases and quick to pick up new tools and technologies.

APPROACH TO FRONT-END ARCHITECTURE

Once wireframes are handed over, I break the design down into a component architecture before development starts: mapping base components, grouped components, blocks and screens in a build spreadsheet to identify what can be made reusable across the project. Components are built dynamic-first, with API data plumbed in at the parent level so child components stay presentational, reusable and easy to test. I complete the structural breakdown, initial build and styling myself, then work collaboratively with one or two developers on larger components and API integration as the project moves towards deadline. I've recently started using Claude Code to support this planning phase, cutting a process that would typically take 2-3 days down to under a day.

TECHNICAL SKILLS

Core: React.js, React Native, JavaScript (ES6+), TypeScript (exposure, upskilling), HTML5, CSS / SCSS

APIs & Backend: REST APIs, Axios, Node.js

Tooling: Docker, Storybook, Xcode, Git / GitHub / BitBucket, VS Code / JetBrains

Styling & CMS: Tailwind, Bootstrap, WordPress (CMS)

AI-Augmented Development: Claude Code (terminal-based AI pair programming), day-to-day use of AI tooling to speed up delivery and learning

Other: Responsive Design, Cross-Platform Development, Agile & Waterfall delivery

WORK EXPERIENCE

Front End Developer

2024 – Present

JB Cole UK (now Bolland & Co)

- Progressed from apprentice into the front-end team, building and maintaining production JavaScript applications, primarily in React and React Native, across web and mobile.
- Acted as sole front-end developer — building independently from component architecture through to screens, before a wider team joined for later-stage API integration — on 2 client projects; collaborated within a small front-end team of 2-3 on the majority of the rest, and picked up legacy codebase and CMS ticket work on several others.
- Integrate REST APIs to connect front-end applications to back-end services, working closely with back-end developers to ensure smooth data flow and robust functionality.
- Apply clean code standards and considered state management (keeping API data at parent/container level, using Context where appropriate) as part of everyday development.
- Use Claude Code day-to-day in the terminal to speed up development, including the component-architecture planning phase, which now takes under a day rather than the usual 2-3.
- Take an active role in code review and daily stand-ups across both Agile and Waterfall projects.
- Beginning to build TypeScript into day-to-day work, extending existing JavaScript knowledge into typed codebases.

Apprentice Software Engineer

2023 – 2024

JB Cole UK

- Gained hands-on experience on real-world front-end projects using React, contributing to bug fixes, UI improvements and API integrations.
- Shadowed senior developers to build understanding of clean code, accessibility and version control best practice.

SELECTED PROJECTS

A selection of the projects above: 2 built solo as initial front-end developer, the majority delivered within a team of 2-3, plus legacy codebase and CMS ticket work on several others.

Sole Front-End Developer — component architecture through to build

LEO – Hair Loss Treatment Platform

leo.hair (main website — front end only, not the Hydrogen checkout) · plus internal prescriptions portal

- Given the designs post-wireframe, independently produced the full component breakdown, then built the front end — structure, screens and styling — solo, mapping base components, grouped components, blocks and screens for reusability, with API data plumbed in at parent level.

- Once the initial build was in place, integrated a number of the API endpoints alongside the lead engineer for the larger, data-heavy components as the project approached deadline.
- Implemented a mobile-first responsive design, working closely with designers to match Figma and brand guidelines.
- Solely built the front end for the separate internal prescriptions portal — an in-house replacement for an external system, used by pharmacists to complete prescriptions — using Claude Code throughout to speed up delivery, handling all prompting and review myself.

Technologies: React, Docker, JavaScript, REST APIs, SCSS, BitBucket, Claude Code

CloudRx

cloudrx.co.uk · plus internal doctors portal

- Led the front-end build of a static marketing site and its internal doctors portal, applying the same component-breakdown approach to structure clean, reusable page templates.
- Delivered fully responsive, brand-aligned pages from wireframe through to client sign-off.

Apps — Form Validation & API Integration (team of 2-3)

Same approach on both: given designs post-wireframe, completed the component breakdown, forms and validation individually, with the wider team supporting remaining API work and back-end communication near deadline:

EdgeX – Dental Training Mobile App

React Native Mobile Application

- Worked within a team of 2-3 to build the app from design through to release; added lazy loading so course content and images — a large volume of material — load only as needed, keeping the app performant.
- Contributed to the secure authentication/login flow and developed dynamic course material and interactive UI components to streamline contractor workflows.

Technologies: React Native, Xcode, Expo Go, BitBucket

Edge Electrical

- Took the app from design through component breakdown, building the forms and validation myself and personally integrating the majority of the API endpoints, with the wider team supporting the remainder and back-end communication as the project neared completion.

Front-End Developer — team collaboration (team of 3)

Contributed to build, styling and API integration across:

- RiskSmart — risksmart.com
- Stax Trade Centres — staxtradecentres.co.uk
- Ballerz — ballerz.co.uk, internal portal and game screens (3 separate projects for the same client)
- Helix — completed FE website (project owned by client, no public link available)
- Suite Spotter — completed FE website (project owned by client, no public link available)
- Sensore Health — sensore.health (tablet app)
- Appeals Centre — appealscentre.eu

Legacy Code & CMS Front-End Support

Picked up tickets on legacy codebases and contributed front-end builds within existing CMS platforms:

- Glindex — glindex.com
- Chase de Vere — chasedever.co.uk
- Solar Configurator — solarconfigurator.co.uk
- Sturge Toth — sturgetoth.com
- Hamerville — hamerville.co.uk (app)

EDUCATION

Software Developer Apprenticeship – Level 4

Manchester Digital

2023 – 2024

Front End Web Development Certification – Bootcamp

University of Birmingham

2022 – 2023

CERTIFICATIONS

- MentorHER – Mentee
- Intro to Web Dev – Code First Girls
- Web Dev Group Project – Code First Girls
- **Codecademy:** Git & GitHub, HTML/CSS, JavaScript, React, TypeScript
